Presentation overview

01 **Problem and research gap**

Explain why the work is needed.

02 **Data and methods**

Define the inputs and core concepts.

03 **Evaluation and results**

Define metrics before interpreting results.

04 **Conclusion and next steps**

State evidence limits and proposed validation.

Build a clear research narrative

Example structure; adjust it to the topic and audience

Start with the problem

Use one concrete situation to motivate the research question.

Explain unfamiliar concepts

Introduce algorithms, symbols and metrics before reporting values.

Keep claim and evidence together

Distinguish observed results, mathematical conditions and proposed work.

Compare three parallel ideas

Plain boxes with a uniform outline and no colored left strip

Context

What is the practical problem?

Which audience needs the answer?

Contribution

What does the work introduce?

What comparison tests it?

Evidence limits

Which conditions were tested?

What remains unknown?

An editable process diagram

Native PowerPoint shapes; adapt the stages to the actual workflow

Input

Name the data and the observable fields.

Preparation

Describe transformations and exclusions.

Method

Explain the decision or computation.

Evaluation

Compare outputs with independent evidence.

Explain formulas before presenting results

Generic weighted score shown only as a notation example

Weighted combination

$$S = \sum_{j=1}^{m} w_j x_j$$

Example constraints

$$w_j \geq 0, \qquad \sum_{j=1}^{m} w_j = 1$$

S: a generic score

x: input components

w: component weights

m: number of components

Replace this illustration with the actual method.

Define reported metrics

Give meaning, unit and direction before showing a result

Error LOWER IS BETTER	Describe the error endpoint and its unit. State what it does not measure.
Agreement HIGHER IS BETTER	Explain what is being compared and the interpretation of the scale.
Latency LOWER IS BETTER	Specify hardware, batch size and measurement boundary.

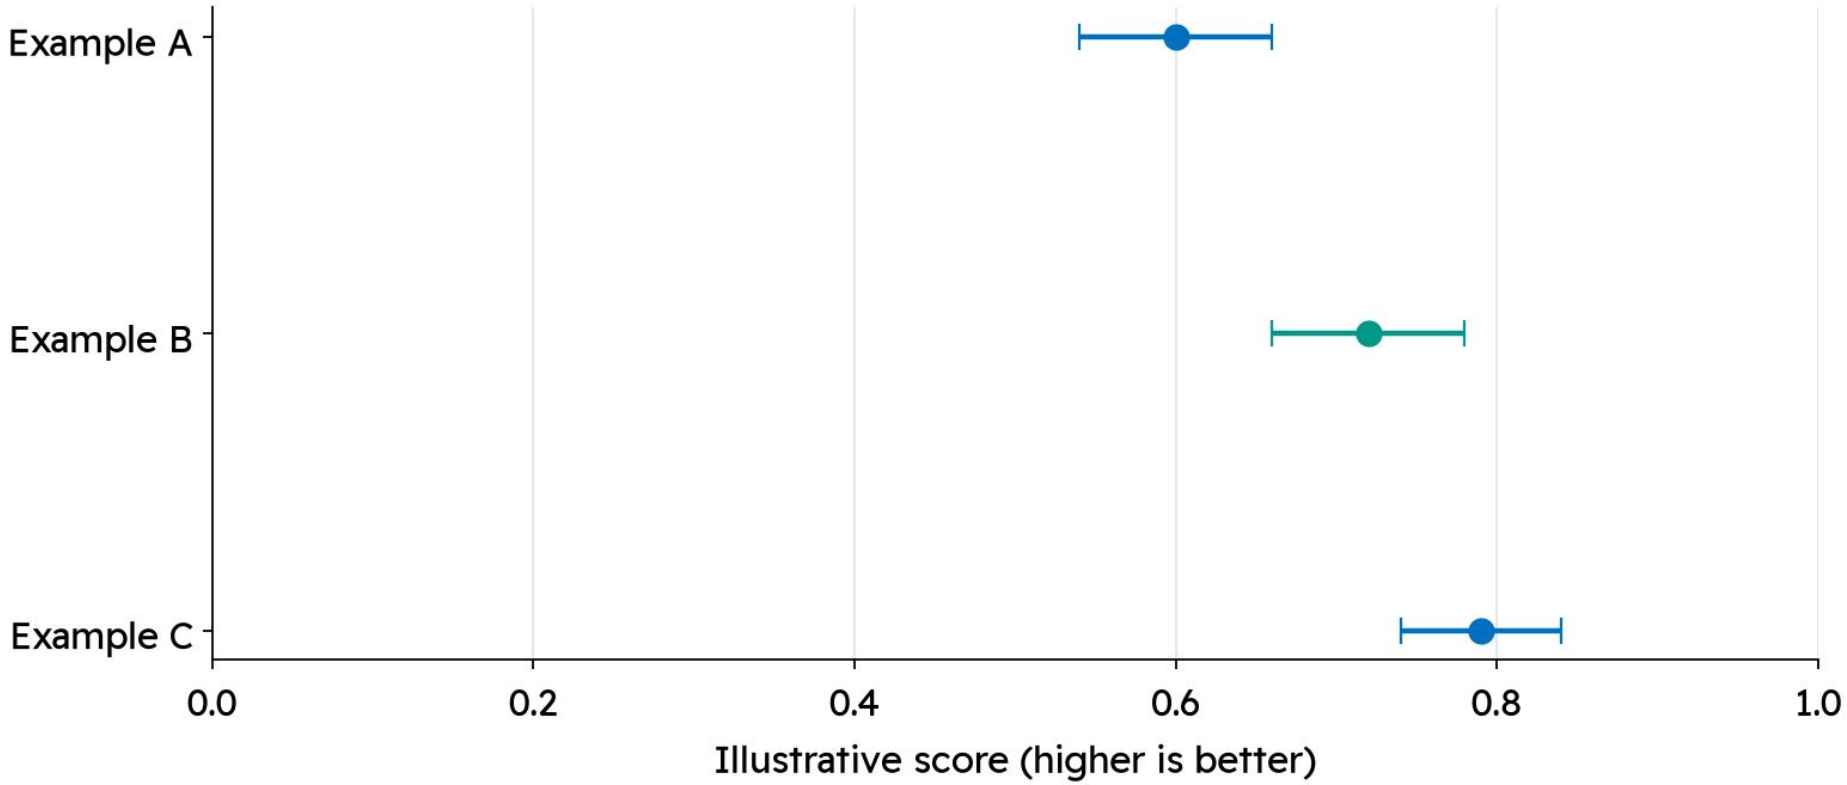

A compact comparison table

Illustrative descriptions; no measured performance is claimed

Aspect	Candidate A	Candidate B
Input	Describe A	Describe B
Assumption	State assumption	State assumption
Evaluation	Name endpoint	Name endpoint

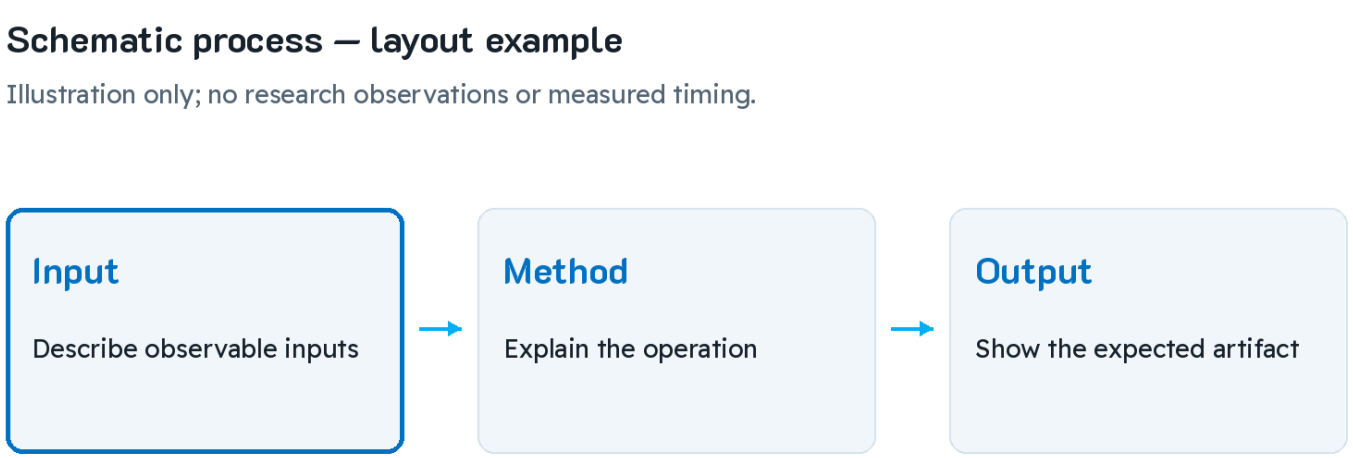

Plot verified data with uncertainty

Layout demonstration — ALL numbers and intervals here are illustrative

Use a large figure with a short explanation

Schematic image; replace it with a relevant source-backed visual

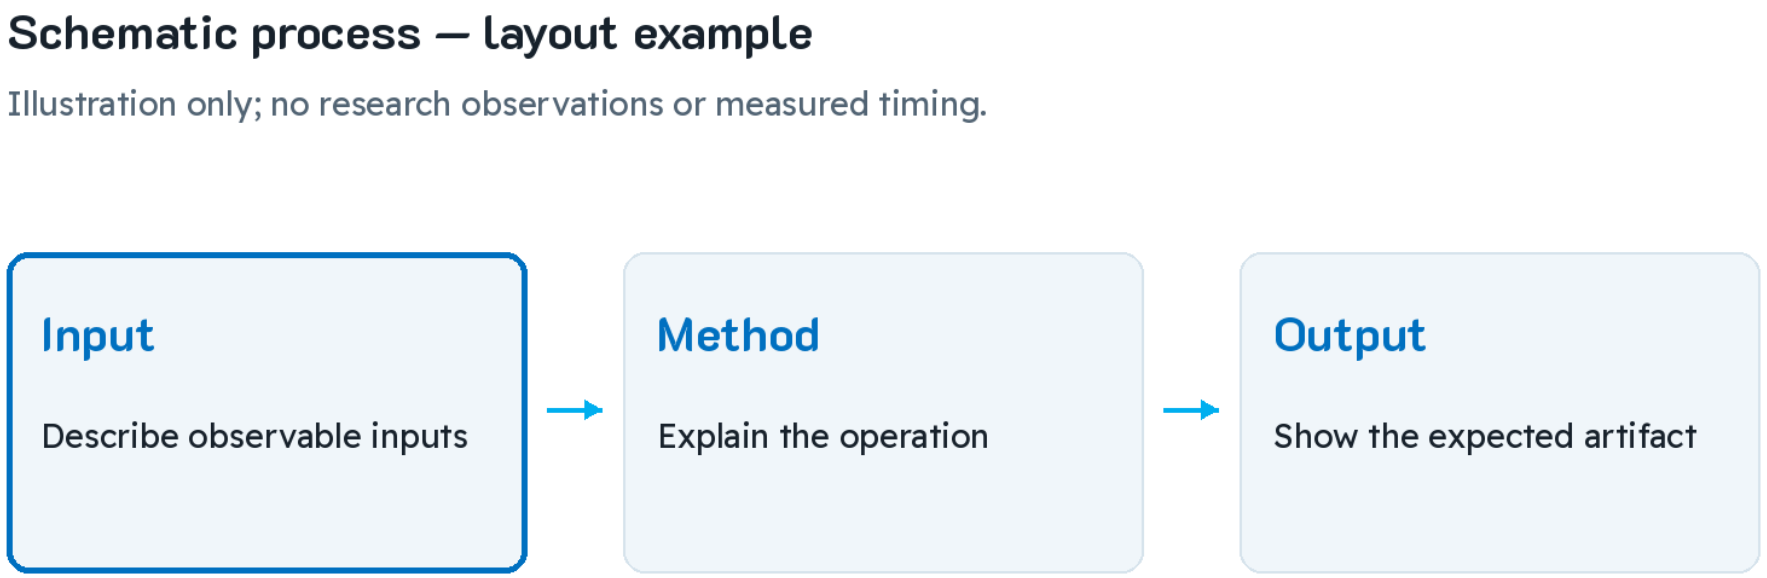

The figure supports one main point.

Keep labels large enough to read.

Put detailed source locators in speaker notes.

Animate only when it explains a change

Schematic GIF assembled from three supplied image frames

Conclusion

State the supported outcome

Tie each conclusion to the evidence actually available.

Retain essential conditions

Keep assumptions and tested scope explicit in the spoken explanation.

Future work

Close a named evidence gap

State a concrete next validation step instead of implying it has been completed.

Keep the scope appropriate

Choose new data, comparisons or deployment checks only when they answer the remaining question.
